

Capable is not adaptive

Five agents I had been building for almost a year. They could reach any data I asked for, and still could not learn from their own mistakes.

WHAT THEY ALREADY HAD

Website

CRM

Paid media

Organic search

Competitive intel

Own tools · own skills · routing table · workflows

DATA LAYER
CRM records · ad platforms · Search Console · dashboards

present from day one, and not a feedback loop

THE LOOP THE COURSE SCORES YOU AGAINST

01 added
Capture

02 added
Detect

03 added
Induce

04 had it
Route

05 added
Propagate

06 had it
Retrieve

07 partial
Prune

the course calls this token space adaptation: you improve an agent by changing what it reads, not by retraining the model

WHAT I ADDED AFTER THE COURSE

01
Traces

02
Failure clustering

03
Skill induction

05
Propagation

07
Provenance

a hook logs every failure the moment it happens, with the command and output.

three missing packages with three names read as one wrong interpreter.

a repeated failure becomes a written procedure, and waits for approval.

one rule sat in five agents as five hashes. Now assembled from one source.

each rule names the failure it watches. Built, and still unproven: none have recurred yet.
